

Executive Summary

This project analyzes **website traffic** data to understand user engagement, traffic patterns, and content performance. Using Python, Pandas, Matplotlib, and Seaborn, the dataset was cleaned, processed, and analyzed to calculate key metrics such as users, sessions, bounce rate, and average session activity.

The analysis identified popular tracks, artists, and geographic regions driving the most traffic. Visualizations were created to explore event distribution, traffic trends, and user behavior patterns. Based on the findings, recommendations were provided to improve user engagement, reduce bounce rates, optimize content, and enhance conversion opportunities.

Overall, this project demonstrates the use of data analytics and visualization techniques to transform raw traffic data into actionable business insights for Alfido Tech.
