

Executive Summary

This project analyzes the Superstore Sales dataset to evaluate sales performance across different regions, product categories, customer segments, and time periods. The data was cleaned, transformed, and analyzed using Python, with key metrics such as Total Revenue, Total Orders, Unique Customers, and Average Order Value calculated to assess business performance.

Various visualizations, including bar charts, pie charts, line charts, histograms, and heatmaps, were used to identify sales trends, top-performing products, customer behavior, and seasonal patterns. The analysis helped highlight key business insights and areas for improvement.

An interactive Power BI dashboard was developed to present the findings in a clear and user-friendly manner. The dashboard includes KPI cards, regional sales analysis, category contribution, sales trends, top products, shipping mode distribution, and interactive filters for deeper exploration.

The project demonstrates how data analytics and visualization can support data-driven decision-making and help businesses improve sales performance, customer engagement, and strategic planning.
